

BASIS OF ENVIRONMENTAL AND ENERGY SUSTAINABILITY OF PRODUCTION

(name of the discipline)

COURSE SYLLABUS ABSTRACT

Specialty 1 – 70 02 01 Industrial and civil construction

Specialization _____

Distribution of academic discipline by semester

	Form of higher education		
	Full-time	Part-time	Part-time reduced
Well	2	1	1
Semester	3	3	2
Lectures, hours	34	8	8
Laboratory classes, hours	16	4	4
Test, semester	3	3	2
Classroom hours per academic discipline	50	12	12
Independent work, hours	58	96	96
Total hours per academic discipline / credit units	108 / 3		

1. Course outline

Environment as a system. Basic laws of ecology and rational nature management. Natural resources and their use. The impact of the enterprise on the environment. Fundamentals of regulation in the field of environmental protection. Environmental quality management tools. Legal regulation of economic activity in nature management. Organization of energy saving management in the Republic of Belarus. Normative-legislative base in the field of energy saving. Ways of obtaining, transporting and using energy. Renewable energy sources. Secondary energy resources. Accounting and regulation of energy resources. Energy saving in industry and construction. Energy saving in buildings and structures. Energy saving at home. Organization of energy management at an industrial enterprise. Energy audit. Development of an energy saving program for an industrial enterprise.

2. Course learning outcomes

Upon completion of the course, students will be expected to know:

- patterns of functioning of natural ecosystems and the biosphere;
 - features of interaction between production and the environment;
 - environmental problems resulting from production (environmental pollution and depletion of natural resources);
 - methods of environmental management in order to reduce the anthropogenic impact and organize sustainable production;
 - the main directions of the state policy in the field of energy saving;
- methods of production, transport and consumption of thermal and electrical energy, as well as the main ways to improve their efficiency;

- environmental and economic problems of energy and the main ways to solve them;

be able to:

- assess the level and consequences of environmental pollution and depletion of natural resources;
- predict the consequences of anthropogenic load on the environment;
- justify the choice of methods to reduce environmental impact;
- use legal documents in the field of environmental protection;
- implement a systematic approach to the organization of energy efficiency,
- evaluate technological processes and devices in terms of their energy efficiency;
- use metering, control and regulation of thermal and electrical energy;
- introduce modern information technologies into practice, form and use databases of energy-efficient technological processes, units and devices;

- use and promote the main methods of energy saving and energy efficiency;

possess:

- analysis of environmental quality criteria;
- methods for determining the state of the environment;
- methods for determining energy saving and energy efficiency of production.

3. Competencies:

Codes of generated competencies	Names of formed competencies
БПК-6	Ensure environmental and energy safety of production processes and safe working conditions in construction

4. Requirements and forms of midcourse evaluation and summative assessment

As a form of monitoring the current progress, the defense of the essay, the test, and the current certification in the form of a test act.
